May 31, 2026

Dear Vera Institute of Justice Hiring Team,

I am excited to apply for the Summer 2026 Data Science Intern, Research Central role. I am an EECS student at UC Berkeley interested in using careful data systems, machine learning, and clear analysis to make messy real-world information more useful for research and decision-making.

My recent work has focused on turning unstructured workflows into reliable data and evaluation systems. At UC Berkeley BAIR, I help build benchmark infrastructure for Agent's Last Exam, converting expert-submitted professional tasks into reproducible runs with artifact capture and deliverable-based scoring. That work has made me comfortable with ambiguity, data quality issues, and building processes that make analysis trustworthy.

I also bring practical engineering experience from Geopogo, where I was the sole engineer on a production AI rendering platform using React, TypeScript, FastAPI, Firebase, and API-based AI workflows. In research with Prof. Avideh Zakhori, I have worked on small-object detection and tracking in drone video, including manual annotation, motion-cue evaluation, and comparison of optical-flow and background-compensation approaches.

Vera's focus on applying data science to justice-system research is meaningful to me because the work requires both technical rigor and responsibility about what the data represents. I would be glad to contribute Python, SQL, GitHub collaboration, and ML/data-preparation skills while learning from Vera's Research Central team.

Thank you for your consideration.

Sincerely,
Yuanbo Pang
